

**RECOVERY PROGRAM**  
**FY 2016-2017 SCOPE OF WORK for:**  
Smallmouth bass control in the White River

Recovery Program Project Number: 167

Reclamation Agreement number: R14AP00007 & R12PG40027  
Reclamation Agreement term: 5/1/ 2014 – 9/31/ 2018; 7/17/2012-3/30/2016

Note: Recovery Program FY16-17 scopes of work are drafted in May 2015. They often are revised before final Program approval and may subsequently be revised again in response to changing Program needs. Program participants also recognize the need and allow for some flexibility in scopes of work to accommodate new information (especially in nonnative fish management projects) and changing hydrological conditions.

I. Title of Proposal: Smallmouth bass control in the White River

II. Relationship to RIPRAP:

White River Action Plan:

III. REDUCE NEGATIVE IMPACTS OF NONNATIVE FISHES AND SPORTFISH MANAGEMENT ACTIVITIES (NONNATIVE AND SPORTFISH MANAGEMENT)

III.B. Reduce negative impacts to endangered fishes from sportfish management activities.

III.B.2.a. Determine and implement an adequate level of mechanical removal to reduce smallmouth bass.

III. Study Background/Rationale and Hypotheses:

The Upper Colorado River Endangered Fish Recovery Program has determined that control of nonnative fish in the upper Colorado River basin is essential to the recovery of the four endangered fish species (USFWS 2002a-c): Colorado pikeminnow (*Ptychocheilus lucius*), razorback sucker (*Xyrauchen texanus*), humpback chub (*Gila cypha*), and bonytail (*Gila elegans*). The highest catch rates of adult and sub-adult Colorado pikeminnow in the Green River sub-basin are observed in the White River (Bestgen et al. 2010). Furthermore, adult razorback sucker, many in spawning condition, have been collected in the White River during

2011 and 2013 spring sampling (CRFP Vernal, unpublished data) and larval razorback sucker were documented for the first time in June 2011 (Webber et al., 2013.), suggesting this species is now utilizing this system for spawning purposes. Additionally, the White River is a stronghold for unlisted native species (Lanigan and Berry 1981; Martinez et al. 1994; Breen and Hedrick 2009, 2010), thus providing an important forage base for Colorado pikeminnow (Osmundson et al. 1998).

Smallmouth bass (*Micropterus dolomieu*) have been documented in the White River for over three decades (Crosby 1975), yet proliferation of this population has not occurred as in other systems (e.g., Yampa River). However, 41 smallmouth bass were collected during one low flow native species sampling pass (42.5 mile reach in Utah) conducted during 2009 (Breen and Hedrick 2010). In addition, increasing numbers of smallmouth bass were collected from 2011-2013 during Colorado pikeminnow abundance estimate sampling. During our initial investigation in 2012, we learned that the majority of smallmouth bass were found in the first ten miles below Taylor Draw Dam, and further downstream densities decreased dramatically. This has continued to be the overall distribution of bass in the river, but adult and sub-adult densities have increased in downstream reaches, particular after low discharge and warm river conditions that are conducive to bass reproduction.

#### IV. Study Goals, Objectives, End Product(s):

##### Goal:

Sufficiently reduce the abundance of adult smallmouth bass in the White River such that their potential to spawn and their predatory and competitive impacts on the growth, recruitment, and survival of endangered and other native fishes is minimized.

##### Objectives:

1. Conduct removal passes for smallmouth bass in the White River from the Taylor Draw Dam (RM 104) to the BLM Enron Takeout (RM 24). Effort will be distributed based on greatest efficiency of bass removal.
2. Determine the feasibility of smallmouth bass removal in the White River and identify levels of control necessary to prevent population expansion.

##### End Product:

An annual report will provide initial information on the extent of the smallmouth bass population in the White River. Metrics to be summarized include: total abundance of adult and juvenile smallmouth bass, total CPUE, CPUE by river mile and size class, CPUE for other nonnatives, and knowledge of spawning and nesting periods and locations.

#### V. Study Area:

The study area encompasses the entire lower White River below Kenney Reservoir (Colorado and Utah), where we will remove smallmouth bass from the Taylor Draw Dam (RM 104) to RMI 87.5, and from the Utah/Colorado border to the BLM Enron Takeout (RM 24). Crews from USFWS CRFP – Vernal, UDWR – Vernal, and Colorado Parks and Wildlife (see SOW 126b) will share the workload to complete removal efforts through this 80 mile sample reach, thus the Colorado/Utah border (RM 72) will serve as break point for two distinct sections. We will not sample the lower 24 miles of the White River given that this is a reach of poor habitat

availability with low fish densities (Breen and Hedrick 2009), and we aim to make best use of our efforts.

#### VI. Study Methods/Approach:

Temporarily reducing riverine smallmouth bass and northern pike populations appears viable under certain environmental conditions but both species can easily reverse these reductions in population abundance and return to pre-removal abundances under favorable environmental conditions (Breton et al. 2014; Zelasko et al. 2015). Therefore, mechanical removal efforts will attempt to reach eradication of nonnative fish populations in the river. However, recent synthesis reports investigating effectiveness of in-river removal efforts for northern pike and smallmouth bass determined that reducing in-river populations of these two species would not be successful unless in-river reproduction and reservoir escapement were controlled (Breton et al. 2014; Zelasko et al. 2015). Therefore, mechanical removal efforts will continue to temporarily suppress riverine populations, and will focus on reducing in-river reproduction when feasible. Simultaneously, Program partners will work on other means to reduce in-river reproduction and reservoir escapement, in order to make mechanical removal more effective and to attempt to reach complete eradication of riverine populations.

Smallmouth bass will be removed primarily by electrofishing. Two electrofishing rafts will simultaneously electrofish each shoreline of the river. Effort will be focused on shoreline habitat that is likely to contain smallmouth bass. Sampling crews will conduct removal activities in a manner that minimizes potential negative impacts to endangered fish as a result of electrofishing activities. This includes discontinuing electrofishing when elevated numbers of endangered fish are known to be present. Electrofishing passes will be conducted from June to early July, focusing on the descending limb of the hydrograph when water temperatures will likely favor smallmouth bass spawning and nesting. During removal passes, all collected smallmouth bass will be disposed of according to Colorado Parks and Wildlife protocols for fish collected in Colorado. We will not tag and release any bass for population estimates.

Several methods will be used in an attempt to identify spawning periods and locations. First, crews will examine shoreline areas for nests and destroy any found. Second, all bass captured will be examined for spawning condition. Finally, the time and locations of YOY smallmouth appearance in catches will be noted and tracked to estimate spawning period and to locate spawning areas. Otolith collection and preservation may provide further insight on exact hatch dates at the request of the Recovery Program.

In addition to the targeted smallmouth bass, other nonnative species encountered will be removed as feasible with the exception of common carp (*Cyprinus carpio*), channel catfish (*Ictalurus punctatus*), and small-bodied cyprinids. All endangered fishes captured will be scanned for a PIT tag, tagged if needed, weighed (g), measured TL (mm), and released alive. Endangered fish data will then be reported to appropriate principal investigators and included in annual reporting.

#### VII. Task Description and Schedule:

Task 1. Smallmouth bass removal effort from Taylor Draw Dam (RM 104) to BLM take-out (RM 87.5); May–July 2016

Task 2. Two smallmouth bass removal passes from the Colorado/Utah border (RM 72) to Enron boat ramp (RM 24); June–July 2016

Task 3. Data entry, analysis, and reporting; October–December 2016

VIII. Deliverables, Due Dates, and Budget by Fiscal Year:  
FY 2016: Annual report due November 2016.

<sup>a</sup> The State of Utah uses Automotive Resources Inc. for motor pool operations. Each motor pool vehicle we rent costs approximately \$6,800/year (includes all charges: fleet rental, mileage, and gas), which is based on the average annual cost for all trucks used in our program.

<sup>b</sup> Boat/motor repair and maintenance includes, but is not limited to oil (3 qts./motor & generator x \$11 qt. x 2 motors & generators x 1 oil change = \$66), 1 prop (\$100), water pump/filters/lower unit oil/grease/gas can/misc. maintenance items (\$500), shop supplies/tools/misc. small parts/safety equipment (\$300).

<sup>c</sup> Camping supplies includes, but is not limited to 1 sleeping pad (Aire-\$150), cooking supplies/propane/toilet supplies (\$300).

<sup>d</sup> Sampling equipment includes, but is not limited to first aid supplies (\$100), 2 life jackets (NRS-\$150), SPOT locator service fee (\$100), satellite phone service/maintenance (\$300), batteries (\$200), straps (NRS-\$150), livewell/buckets/fish nets/measuring boards (\$100), raft repair and misc. raft materials (\$500).

<sup>b,c,d</sup> Estimated costs based on current prices procured from various sources and previous expenditures for items under each category; outyears (FY2015 and beyond) include an annual 2% cost of living increase.
