

**COLORADO RIVER RECOVERY PROGRAM
FY-2018-2019 SCOPE OF WORK**

Project No.: 127

Colorado pikeminnow population estimates - Colorado River

Reclamation Agreement number: R15PG00083

Reclamation Agreement term: Oct. 1, 2014 – Sep. 30, 2019

Lead Agency: U.S. Fish and Wildlife Service
Grand Junction Fish and Wildlife Conservation Office

Submitted by: Darek Elverud, Fish Biologist
Dale Ryden, Project Leader

I. Title of Proposal: Monitoring the Colorado pikeminnow population in the mainstem Colorado River via periodic population estimates.

II. Relationship to RIPRAP:

Colorado River Action Plan: Colorado River Mainstem,

V. Monitor populations and habitat and conduct research to support recovery actions.

V.A. Conduct research to acquire life history information and enhance scientific techniques required to complete recovery actions.

III. Study Background/Rationale and Hypotheses:

The currently-accepted standard for monitoring populations of Colorado River endangered fishes is to periodically develop population estimates using closed-model capture-recapture methods. Such estimates provide information on population status (abundance), and when repeated periodically over an extended period can also provide information on population trends. Such estimates have been made for the Colorado River population of Colorado pikeminnow for fifteen years: 1992-1994, 1998-2000, 2003-2005, 2008-2010, and 2013-2015 (see Osmundson and Burnham 1998, Osmundson 2002, Osmundson and White 2014).

Recovery goals for Colorado pikeminnow require that three annual population estimates be conducted from 2018-2020 (Program Director's Office 2002). During the first two 3-year efforts, time, manpower and funding limitations allowed only a minimal sampling regime in the Colorado River. This consisted of three passes, or capture efforts, through the upper reach (upstream of Westwater Canyon) and two through the lower reach (downstream of Westwater Canyon) each year. This was largely accomplished with one 2-person crew. In addition, data from annual ISMP electrofishing surveys were also included which provided part of one of the passes in each reach. Without this help, the two-person crew would not have been able to complete the sampling regime. Even with this assistance, estimates were considered generally inadequate based on wide confidence intervals, low probability of capture (p), and high coefficients of variation (CV). Pollock et al. (1982) suggests a good 'rule-of-thumb' is to achieve a CV of 20% or less. During 1991-1994 and 1998-2000, annual CV for pikeminnow >450 mm TL ranged from 15.4% to 45.5% in the upper study reach, and from 39.2% to 64.4% in the lower study reach. Annual ISMP electrofishing surveys have since been discontinued; hence, future field efforts will need to be much greater to make estimates more precise and make up for the shortfall left from discontinuing ISMP. To improve estimates, a target of four passes in the lower reach (Cisco, UT to the Colorado/Green River confluence) and five passes in the upper reach (upstream of Westwater Canyon to Government Highline Dam) was adopted for the Colorado River. In addition, increased effort per pass also improves precision of estimates. In the past, trammel-netting backwaters yielded many more pikeminnow per day of effort than did electrofishing shorelines. However, at any one time, there may be many pikeminnow that are not in the backwaters; hence, our current capture strategy includes a combination of electrofishing shorelines and trammel-netting backwaters. This expanded effort is intended to increase capture probabilities and decrease coefficients of variation, resulting in greater precision of the point estimates. This sampling regimen was employed during 2003-2005 and 2008-2010. The overall mean CV of the twelve annual combined-reach estimates for fish > 450 mm TL was 16.8% (Osmundson and White 2014). During the most recent three-year effort (2008–2010), the mean CV was 13.2%, the best (lowest) of any of the four multi-year efforts (first three years: 25%; second three years, 14.3%; third three years, 15.2%). However, the best single year was 2005, with a CV of 9.4%. The current regimen of increased effort and number of annual passes is scheduled to be continued in 2018-2020.

IV. Study Goals, Objectives, End Product:

Goal

Our goal is to provide three annual whole-river estimates of population abundance for Colorado pikeminnow ≥ 250 mm TL and for Colorado pikeminnow ≥ 450 mm TL in the Colorado River mainstem, with coefficients of variation of 20% or less.

Objectives

1. Capture and mark juvenile (< 400 mm TL), sub-adult (400-450 mm TL) and adult (> 450 mm TL) Colorado pikeminnow throughout the river for a three-year period, attempting to complete five passes through the upper reach (upstream of Westwater Canyon) and four through the lower reach (downstream of Westwater Canyon) each year.
2. Develop a population estimate from mark-recapture data.
3. Assess recruitment trends by analyzing length-frequency histograms and estimating abundance of individuals 400-450 mm TL.
4. Also, reduce centrarchid and walleye abundance in the study area by removing those encountered during field sampling so as to help meet objectives of Project 126 (bass removal).
5. Capture razorback sucker and bonytail opportunistically for assessment of their populations. Development of abundance estimates for razorback sucker using mark-recapture data collected here will be covered under a separate scope of work.

End Product

Provide a final report on study findings. A draft report for the 2018-2020 sampling period will be ready for peer review on August 30, 2021. A draft final report will be ready for approval consideration October 31, 2021. Report to be finalized December 31, 2021.

V. Study Area:

The Colorado River will be sampled from Government Highline Dam (RM 194.4) downstream to the confluence with the Green River (RM 0.0), excluding Westwater Canyon (12 miles: rm 112-124), from early-April to late-June, 2018-2020. In addition, the lower 2.3 miles of the Gunnison River downstream of Redlands Diversion Dam will also be sampled, as fish utilizing this reach are generally part of the Colorado River population. Hence, a total of 179 miles will be sampled. The rationale for omitting Westwater Canyon is that sampling there requires specialized whitewater expertise, is time consuming, and, based on past experience, will yield very few pikeminnow (captures have averaged about one per year over nine years despite intensive sampling associated with other studies [unpublished Recovery Program database data]).

VI. Study Methods/Approach:

Juvenile, sub-adult and adult Colorado pikeminnow will be captured from throughout the Colorado River study area. In each of two sub-reaches (upstream and downstream of Westwater Canyon), there will be two crews working concurrently: one 2-person crew will electrofish shorelines while another two-person crew will trammel-net flooded backwaters. During low water periods, only electrofishing sampling will be deployed. There will therefore be a total of four 2-person crews working simultaneously at any one time (eight individuals). Additional individuals will be required to run shuttles, clean nets and maintain

equipment. An additional person will also be needed to pilot a baggage boat when sampling in Canyonlands is conducted. In some reaches, where backwaters are scarce, both shorelines will be electrofished, either concurrently or on separate days. In reaches where shoreline electrofishing supplements backwater netting, the electrofishing crew will sample both shorelines, targeting what the driver believes to be the best habitats. No electrofishing will occur in backwaters; and electrofishing boats that get out ahead of netting crews will steer clear of backwater mouths to avoid scaring fish from these areas. Concurrent crews working in the same reach will embark at the same location but will be prepared to operate and work up fish independently. The technique, or combination of techniques, that most effectively samples the pikeminnow population varies by reach, and some flexibility will be required to modify sampling protocols as reach and flow conditions vary. All fish will be measured for total length (mm), weighed with an electronic balance (nearest gram) and checked for the presence of a PIT-tag. If a PIT tag is not present the fish will be marked with one.

For concurrent bass removal efforts, all centrarchids will be measured and removed from the river as well as other non-native predators that may be encountered such as northern pike and walleye. These will be frozen, and either transferred to Colorado Parks and Wildlife or deposited in the county landfill. Data will be turned over to the Principle Investigator for Project 126a (centrarchid removal) for inclusion in their analysis.

The Principal Investigator will train crew members, act as overall crew leader and actively participate in data collection efforts. One higher-grade technician, certified for electrofishing, will be present in each reach, and will function as a sub-reach crew leader. Although the duration of the annual data collection effort is anticipated to be 11-12 weeks, additional time will be required prior to field sampling to ready equipment and train new crew members in motor boat operation and field techniques specific to this project.

The Principal Investigator will work closely with a biostatistician familiar with running program MARK or other appropriate mark-recapture programs that develop estimates of population abundance and rates of survival. Size structure of the population will be analyzed and compared against earlier data (1991-1994, 1998-2000, 2003-2005, 2008-2010, 2013-2015) to determine recent trends in recruitment frequency, identification of strong year-classes, etc. Average body condition will also be monitored as a means to assess fish health.

VII. Task Description and Schedule

Description

- Task 1. Capture and PIT tag Colorado pikeminnow (early April-late June)
- Task 2. Input and analyze data
- Task 3. Write annual reports
- Task 4. Prepare final report

Schedule

Task 1:	2018, 2019, 2020
Task 2:	2018, 2019, 2020
Task 3:	2018, 2019, 2020
Task 4:	2021

VIII. **FY-2018 – First Year of Three Year Sampling Rotation**

Deliverables/Due Dates: Annual Report for field work due 11/2018
